Body shaping

Sports Field

Relaxation after sports
Sports recovery
Sports injury
Cycling racing club
Football and basketball club

Massage Field

New air massager; mini personal massager
360 degrees massage
Compression massage
leg/arm/waist massager
Electric massage therapy machine

• Air compression leg massager offers therapeutic benefit for anyone with a sedentary lifestyle or who is temporarily convalescent. The sleeve of our calf circulation massager regularly compresses and releases pressure to stimulate blood flow. Offers immediate relief during long commutes or while working at a desk for extended durations. May enhance recovery from convalescent care, such as confinement to a bed or during limited mobility where blood flow can be a particular concern.

• Smart variable inflation and compression leg wrap. Offers three settings of air compression massage and is adjustable using the control panel attached to the cuff. Comes with one cuff to massage either leg, or can easily be moved back and forth to massage both legs.

• Velcro-fitted, cordless, and easily adjustable to meet your personal fit and ideal comfort. Easy touch control panel comes attached as shown. Wireless panel requires 2 AA batteries, not included. Simply select the intensity and the circulation leg wrap starts a compression session. Cuff automatically turns off to help conserve battery life. If the lowest setting causes pain or discomfort, simply loosen the Velcro fitting to further decrease the compression.

• The air compression leg massager may offer therapeutic treatment to the lower legs due to discomfort caused by a variety of ailments, including lymphoma, poor circulation, neuropathy, swelling from fluid retention, and more. The circulation massager may also relieve common aches and stiffness brought on by long hours at a desk job, lengthy drives, and temporary or long term immobility during convalescent care.

• Use compression leg wrap as directed for therapeutic relief. Results of air compression massage may vary by individual. If persistent discomfort occurs, you should consult a physician before continuing treatment.
